

Based on your uploaded resume, here are **step-by-step Agile and SDLC methodology questions and answers** tailored to your experience in **AWS, DevSecOps, Linux, and CI/CD**. These are categorized for **HR, technical rounds, and scenario-based interviews**, aligned with your three projects.

---

## AGILE METHODOLOGY QUESTIONS & ANSWERS

### 1. What is Agile methodology? How have you used it in your projects?

**Answer:**

Agile is an iterative and incremental software development methodology focused on collaboration, customer feedback, and small, rapid releases.

In my projects, Agile was implemented using 2-week sprints, daily stand-ups, sprint planning, and retrospectives. We used tools like Jira/Trello (or internal equivalents) to track progress. My role involved delivering CI/CD automation and infrastructure tasks in each sprint.

---

### 2. Which Agile ceremonies did you participate in?

**Answer:**

- **Daily Stand-ups:** Discussed task updates, blockers, and progress.
  - **Sprint Planning:** Estimated story points and planned infrastructure/DevOps deliverables.
  - **Sprint Review:** Showcased automated pipelines or infrastructure updates.
  - **Retrospective:** Shared what went well, challenges, and improvement points.
- 

### 3. What was your role in an Agile team?

**Answer:**

As a Cloud/DevOps Engineer, I was part of the Scrum team responsible for:

- Automating deployments using CodePipeline.
  - Writing scripts (Bash, YAML) for CI/CD and Linux server automation.
  - Integrating monitoring (CloudWatch, SNS) and security checks in the delivery pipeline.
- 

### 4. How did you handle requirements or changes mid-sprint?

**Answer:**

We followed Agile best practices. Any change was documented as a new story or sub-task and reviewed for impact. If critical, the Product Owner re-prioritized and brought it into the current sprint with team consensus.

---

## 5. How do you ensure collaboration with Developers/Testers in Agile?

### Answer:

We used GitHub and CodeCommit for version control, and CI/CD tools like CodeBuild and CodeDeploy ensured fast feedback. Logs, alerts, and test results were shared regularly through CloudWatch and SNS, ensuring Dev-Test-DevOps collaboration.

---

## SDLC (Software Development Life Cycle) QUESTIONS & ANSWERS

### 1. What SDLC model was used in your project?

#### Answer:

We followed the **Agile SDLC model**, which includes:

1. Requirement gathering
2. Design
3. Implementation
4. Testing
5. Deployment
6. Maintenance

Each phase was part of short, iterative sprints.

---

### 2. Explain how you contributed to each SDLC phase in your DevOps projects.

#### Answer:

- **Requirement Gathering:** Collaborated to understand infrastructure and automation needs.
  - **Design:** Designed CI/CD pipelines, VPC architecture, and security policies.
  - **Implementation:** Developed Bash/YAML scripts, built CodePipeline/CodeBuild flows.
  - **Testing:** Integrated security and unit test stages in CI/CD.
  - **Deployment:** Automated deployments to EC2 and S3 with rollback.
  - **Maintenance:** Monitored systems, automated backups, and handled patch management.
- 

### 3. What is your approach to deployment in SDLC?

#### Answer:

I automate deployments via AWS CodePipeline integrating CodeCommit, CodeBuild, and CodeDeploy. I configure **buildspec.yml** and **appspec.yml** for build and deployment strategies, use SNS for alerts, and implement rollback mechanisms in case of failure.

---

#### 4. How do you handle post-deployment monitoring and maintenance?

**Answer:**

I use:

- **CloudWatch:** To monitor CPU, memory, and disk usage.
  - **SNS:** For alert notifications.
  - **IAM:** For audit and compliance tracking.
  - I also configure cron jobs and automate log backups for regular maintenance.
- 

#### SCENARIO-BASED QUESTIONS (Agile + SDLC)

##### 1. You found a vulnerability in a deployed application. How did you respond?

**Answer:**

- Reported it during the daily stand-up.
  - Created a new Jira task to fix it.
  - Patched the vulnerability through updated bash scripts or pipeline policies.
  - Triggered a secure deployment via CodePipeline.
  - Monitored post-deployment health via CloudWatch.
- 

##### 2. How do you integrate security in the SDLC (DevSecOps)?

**Answer:**

- Integrated security scanning in **CodeBuild** phase using tools and custom scripts.
  - Applied **IAM policies**, **S3 bucket policies**, and **WAF rules** during design and implementation.
  - Enforced least privilege and continuous compliance checks in CI/CD.
- 

##### 3. What happens if a build fails in CodeBuild during a sprint?

**Answer:**

- Investigate the logs in CloudWatch.
- Notify the team through SNS/email integration.
- Fix the issue (script error, dependency failure, etc.).
- Push the fix and rerun the pipeline.
- Document RCA for retrospective.

---

#### 4. How did you plan and estimate infrastructure tasks during sprints?

**Answer:**

Used historical sprint data and complexity-based story points. For example, EC2 setup with hardening might take 3 points, CI/CD pipeline with rollback takes 5 points. Collaborated with the team during sprint planning to ensure realistic estimates.

---

#### 5. Explain a challenge you faced while implementing Agile in DevOps.

**Answer:**

Initially, build failures delayed sprint deliverables. I implemented better version control practices, broke large builds into micro-stages, and integrated pre-commit hooks and test checks, which reduced build failures by 40%.

---

#### KEYWORDS FOR INTERVIEW

- CI/CD in Agile
  - DevSecOps integration in SDLC
  - Cloud-native design in Agile
  - Infrastructure-as-Code in sprints
  - CodePipeline lifecycle stages
  - CloudWatch & SNS integration for monitoring
  - Post-production support in Agile cycles
- 

Would you like a **customized mock interview script** for Agile/SDLC questions based on this?
