Here's a detailed comparison table showing **similar services** across **AWS, Azure, GCP, and Laravel Cloud** based on the categories you mentioned:

Service Category	AWS	Azure	GCP	Laravel Cloud
1. Compute Services	Amazon EC2	Azure Virtual Machines	Google Compute Engine	Laravel Forge (provision VMs)
2. Storage Services	Amazon S3	Azure Blob Storage	Google Cloud Storage	Laravel Vapor File Storage
3. Database Services	Amazon RDS, DynamoDB	Azure SQL Database, Cosmos DB	Cloud SQL, Firestore, Bigtable	Laravel Vapor Database (RDS integration)
4. Networking Services	Amazon VPC, AWS Direct Connect	Azure Virtual Network, ExpressRoute	VPC, Cloud Interconnect	Managed via Vapor/Forge provisioning
5. Serverless Compute	AWS Lambda, API Gateway	Azure Functions, API Management	Cloud Functions, API Gateway	Laravel Vapor (serverless PHP hosting)
6. Container Services	Amazon ECS, Amazon EKS	Azure Kubernetes Service (AKS), ACI	GKE (Kubernetes), Cloud Run, Cloud Build	Not directly supported (use Forge/Vapor)
7. Identity & Access Mgmt	AWS IAM	Azure Active Directory, RBAC	Cloud IAM	Role-based teams in Laravel Forge/Vapor
8. Monitoring & Logging	Amazon CloudWatch, AWS CloudTrail	Azure Monitor, Log Analytics	Cloud Monitoring, Cloud Logging, Cloud Audit	Vapor metrics, Laravel Telescope
9. Dev & Deployment Tools	CodePipeline, CodeDeploy, CodeBuild	Azure DevOps, GitHub Actions	Cloud Build, Deployment Manager, Skaffold	Laravel Forge (CI/CD), Envoyer (Deploy)

Notes:

- **Laravel Forge** is used for managing infrastructure (VMs, Nginx, PHP, MySQL) on providers like AWS, DigitalOcean, etc.
- **Laravel Vapor** is a serverless deployment platform designed for Laravel, fully integrated with AWS services like Lambda, S3, RDS, CloudFront, etc.
- **Laravel Envoyer** is a zero-downtime deployment tool for PHP applications.
- **Azure** and **GCP** offer broader native support for multi-language apps; Laravel support comes via manual setup or containers.

Let me know if you'd like this table as a downloadable PDF or with architectural diagrams.
