Here is a **detailed comparison table** of the **types of AWS and Laravel Cloud subscriptions**, including their **features, pricing, and use cases**:

AWS vs Laravel Cloud Subscription Types (Comparison Table)

Feature / Aspect	AWS Free Tier	AWS On-Demand / Pay-As-You-Go	AWS Reserved Instances / Savings Plans	AWS Enterprise Support	Laravel Cloud Starter Plan	Laravel Cloud Business Plan	Laravel Cloud Enterprise Plan
Provider	Amazon Web Services (AWS)	AWS	AWS	AWS	Laravel Cloud	Laravel Cloud	Laravel Cloud
Type	Free trial / learning tier	Flexible pricing model	Long-term commitment for savings	Premium support plan	Basic hosting for Laravel apps	Advanced hosting with extra features	Full-stack scalable enterprise hosting
Subscription Cost	Free (12 months + some perpetual free services)	Pay per hour/month for usage	Up to 72% cheaper than On-Demand (1/3 year)	Starts at $15,000/month	Starts ~$12/month	Starts ~$25/month	Custom pricing (varies per org)
Best For	Beginners, learners, small experiments	Startups, SMBs, flexible usage	Long-running production workloads	Large enterprises needing dedicated support	Solo developers or hobbyists	Small-to-medium Laravel teams	Large Laravel-based enterprise apps
Compute Resources	EC2 (750 hrs/month),	EC2, Lambda, Fargate, etc.	Same as On-Demand	Same as On-Demand	1 container (Nginx + PHP + Queue	Multiple containers, more queues	Fully scalable containers and services

	Lambda (1M req), etc.				workers)		
Storage	5 GB S3, 30 GB EBS	S3, EBS, EFS, etc. (billed separately)	Same as On-Demand	Same as On-Demand	Limited disk (shared hosting-style)	Increased disk size, persistent storage	Customizable, full persistence
Databases	750 hrs RDS (t2.micro)	RDS, DynamoDB, Aurora, etc.	Same as On-Demand	Same as On-Demand	Built-in MySQL (shared)	Dedicated DB instance (optional)	Managed DB clusters
Scalability	Very limited	Highly scalable	Highly scalable	Highly scalable	Low	Moderate	High (auto-scaling possible)
Support Level	Basic docs and community	Basic, unless support plan purchased	Basic, unless support plan purchased	24/7 tech account manager, architectural support	Email/ticket-based	Priority support	Dedicated support
CI/CD Integration	Manual setup (CodePipeline, CodeBuild, etc.)	Manual or automated with DevOps tools	Same as On-Demand	Advanced CI/CD best practices	GitHub integration, auto-deploy	Full CI/CD pipeline	Enterprise Git/CI integrations
Monitoring/Logs	Basic (CloudWatch, X-Ray)	Advanced with CloudWatch, CloudTrail	Same as On-Demand	Full observability solutions	Basic logs	Advanced logs, queue monitoring	Full application monitoring, alerts
Security & Compliance	Shared responsibility model	Full IAM, WAF, GuardDuty, etc.	Same as On-Demand	Security and compliance assistance	SSL, rate limiting	Custom domains, HTTPS, ACLs	Role-based access, GDPR/SOC2 support

Custom Domains	Manually via Route 53	Yes (any domain)	Yes	Yes	Yes	Yes	Yes
Usage Limits	Strict (12-month limit + usage caps)	Based on budget	Based on reserved instance terms	Unlimited (enterprise -scale)	Limited bandwidth and storage	Higher limits	Custom quotas

---

Key Takeaways:

- **AWS Free Tier** is ideal for beginners or experimentation, while **On-Demand** and **Reserved** instances offer production flexibility and cost savings.
- **Laravel Cloud** is a **specialized platform for Laravel applications**, offering **zero-config deployment**, **queues**, **cron**, and **auto-scaling**.
- Laravel Cloud subscriptions are **simpler but more opinionated**, whereas AWS offers **greater control and customization** across all layers (IaaS/PaaS).

Would you like a **project comparison** between an app hosted on **Laravel Cloud vs AWS**, or how to **migrate Laravel from Laravel Cloud to AWS EC2 or Elastic Beanstalk**?

Here is a **detailed project comparison** between hosting a **Laravel application** on **Laravel Cloud vs AWS**, focusing on setup, deployment, scalability, cost, DevOps, and developer experience.

Laravel Cloud vs AWS Hosting for a Laravel Application – Project Comparison

Feature / Aspect	**Laravel Cloud**	**AWS (e.g., EC2, Elastic Beanstalk, ECS, etc.)**
Purpose	Laravel-optimized PaaS for fast and easy deployment	General-purpose cloud with full control and scalability
Setup Time	~5-10 minutes	~1–3 hours depending on service (EC2, EB,

		ECS)
Developer Experience	Laravel native, Git-based deploy, simple UI/CLI	Requires DevOps knowledge (SSH, VPC, IAM, networking, CI/CD setup)
Deployment Method	git push or GitHub integration	Manual (EC2) or CI/CD via CodePipeline, Jenkins, GitHub Actions
CI/CD Pipeline	Built-in with GitHub/GitLab	Custom pipeline using CodePipeline, CodeBuild, Jenkins, etc.
Server Management	No server management needed (managed containers)	Full server provisioning, updates, patching, and monitoring
Queue Management	Built-in Laravel queue support	Must set up SQS, Redis, or RabbitMQ manually
Cron Scheduling	Laravel scheduler UI included	Needs to configure crontab on EC2 or use EventBridge/Lambda on AWS
SSL/HTTPS	Automatic SSL with custom domain	Manual SSL setup (ACM + ELB or Let's Encrypt)
Scalability	Auto-scaling containers (Business/Enterprise plans)	Manual (EC2 ASG) or managed auto-scaling (Elastic Beanstalk, ECS)
Cost Estimation	Predictable (~$12–$25/month for most apps)	Variable ($10–$100+/month depending on setup and usage)
Database Support	Managed MySQL/PostgreSQL (per plan)	RDS (fully managed), self-hosted MySQL on EC2, Aurora
File Storage	Limited (local or mounted disk)	Amazon S3 for scalable, secure storage
Logging & Monitoring	Built-in app logs, queues, deployment logs	CloudWatch, X-Ray, ELK stack setup needed
Custom Domain	1-click domain + HTTPS	Route 53 + ELB or EC2 + manual domain setup

Security	SSL, rate-limiting, firewall	Full IAM, VPC, WAF, GuardDuty, encryption, audit logging
Support	Laravel community + ticket-based support	Tiered support (Free, Developer, Business, Enterprise)
Ideal For	Laravel-only apps, startups, indie developers	Large Laravel apps, enterprise-grade solutions, microservices

---

Example Scenario – Laravel Blog Application

Component	**Laravel Cloud**	**AWS Example (EC2)**
Compute	1 Laravel container	EC2 t3.small instance with Apache + PHP + Laravel
Database	Shared MySQL (plan-based)	RDS MySQL (db.t3.micro)
Storage	Mounted disk or local storage	Amazon S3 bucket
SSL	Auto-enabled	ACM certificate + Application Load Balancer
Queue	Worker container (Horizon/Redis)	Redis on EC2 or ElastiCache + Laravel queue
Deployment	GitHub auto-deploy	GitHub Actions or CodeDeploy
Monitoring	In-app logs UI	CloudWatch Logs + Custom Alarms

Summary:

Use Case	Laravel Cloud	AWS
Quick start, minimal DevOps	✅ Best choice	❌ Complex setup
Full control over infrastructure	❌ Limited	✅ Full control
Highly scalable enterprise app	⬜ (only in higher plans)	✅ Yes (auto-scaling, distributed systems)
Best for Laravel-specific deployments	✅ Fully integrated	✅ With custom config
Cost-effective for small projects	✅ Lower and predictable	❌ Costs scale with usage

---

Recommendation:

- Choose **Laravel Cloud** if you:
  - Want fast, zero-config deployment for Laravel.
  - Are a solo developer, small team, or startup.
  - Don't want to manage infrastructure.
- Choose **AWS** if you:
  - Need complete control, scalability, and integration with enterprise services.
  - Plan to host multiple apps/microservices.
  - Have DevOps resources or need advanced cloud features.

Would you like a **step-by-step guide** to deploy a Laravel app on either **Laravel Cloud** or **AWS EC2 / Elastic Beanstalk**?
