Here's a table listing **heavyweight servers** that can be installed on Docker for deploying applications and running on Docker containers on **Ubuntu 22.04**. These are generally **feature-rich, full-stack, or enterprise-grade** servers that consume more resources compared to lightweight servers:

Server Name	Type	Used For	Docker Image Example	Approx RAM Usage	Notes
Apache Tomcat	Application Server (Java)	Java web applications (WARs)	tomcat	512 MB – 1 GB	Java servlet container, often used for Spring apps
WildFly (JBoss)	Application Server (Java EE)	Enterprise Java applications	jboss/wildfly	1 GB – 2 GB	Full JEE stack support
GlassFish	Application Server (Java EE)	Java EE web services and applications	glassfish	1 GB – 2 GB	Oracle-backed, used for enterprise Java
WebLogic Server	Application Server (Java EE)	Enterprise Java workloads	(Custom Docker build required)	2 GB+	Requires Oracle license; used in legacy enterprise
WebSphere Liberty	Application Server (Java EE)	IBM enterprise Java applications	openliberty/open-liberty	1 GB – 2 GB	Lightweight version of IBM WebSphere
Microsoft IIS	Web Server (Windows only)	ASP.NET, .NET Framework apps	mcr.microsoft.com/windows/servercore/iis	1.5 GB – 3 GB	Only runs on Windows Docker containers
NGINX Plus	Web Server (Enterprise)	Advanced reverse proxy, load balancer	(Custom, requires license)	512 MB – 1 GB	Enterprise features like monitoring, JWT, etc.
Apache HTTPD	Web Server	Hosting websites, reverse proxy	httpd	500 MB – 1 GB	Full-featured; heavier than NGINX OSS

Jetty	Application Server (Java)	Java web apps, servlet container	eclipse/jetty	500 MB – 1 GB	Alternative to Tomcat
OpenShift Container Platform	PaaS / App Platform	Kubernetes-based app platform	(Runs as VM/docker-in-docker in dev)	4 GB+	Full PaaS; often used in enterprise Kubernetes
Nextcloud	Collaboration Server	File sharing and groupware	nextcloud	1 GB – 2 GB	Requires PHP, Apache/NGINX, database
Zimbra	Email & Collaboration Server	Mail server, calendar, contacts	(Community Docker images available)	2 GB+	Complete mail server with web client
OpenProject	Project Management Server	Agile PM, tasks, Gantt, time tracking	openproject/community	1 GB – 2 GB	Used for enterprise PM
GitLab CE	DevOps Platform	Git hosting, CI/CD, DevOps workflows	gitlab/gitlab-ce	4 GB+	Heavy but feature-rich
Jenkins	CI/CD Server	Automation, build/test/deploy	jenkins/jenkins	1 GB – 2 GB	Java-based CI tool
SonarQube	Code Quality Server	Static code analysis	sonarqube	2 GB+	Java-based, needs DB
Keycloak	Identity & Access Server	SSO, OAuth2, Identity Provider	quay.io/keycloak/keycloak	1 GB – 2 GB	Java-based IAM server
OpenLDAP	Directory Server	Identity & authentication directory	osixia/openldap	500 MB – 1 GB	Lightweight for LDAP, but can become heavier

---

Notes:

- **Heavyweight** here is relative to resource consumption and feature set.

- All servers can be installed on **Docker containers on Ubuntu 22.04**, assuming Docker is properly set up.
- You can adjust memory/CPU usage in Docker Compose or docker run using --memory and --cpus flags.
- Most Java EE servers tend to be heavier by nature compared to lightweight web servers like NGINX or Caddy.

Would you like a comparison with **lightweight alternatives** or **Docker Compose examples**?
