Here is a table listing **commonly available default servers/services** that are typically used for **deploying applications or running services** on **Ubuntu 22.04 LTS**. These may not all come pre-installed, but they are available in Ubuntu's official package repositories and widely used in production:

Category	Server / Service	Purpose / Use Case	Default Package Name
Web Servers	Apache HTTP Server	Static/dynamic web hosting (HTML, PHP)	apache2
	Nginx	High-performance web server and reverse proxy	nginx
Application Servers	Tomcat	Java web application hosting (WAR files)	tomcat9, tomcat10
	Gunicorn	Python WSGI HTTP server for Flask/Django	gunicorn
	uWSGI	Application container server for Python apps	uwsgi, uwsgi-plugin-python3
	Node.js	JavaScript runtime/server for Node apps	nodejs
Database Servers	MySQL / MariaDB	Relational database management system (RDBMS)	mysql-server, mariadb-server
	PostgreSQL	Advanced RDBMS	postgresql
	MongoDB	NoSQL document database	Not in default repo, use MongoDB APT
	Redis	In-memory key-value store/cache	redis-server
	SQLite	Lightweight file-based RDBMS (embedded)	sqlite3

FTP / File Servers	vsftpd	FTP server	vsftpd
	Samba	Windows-compatible file sharing	samba
	NFS	Network File System server	nfs-kernel-server
Mail Servers	Postfix	SMTP server (sending mail)	postfix
	Dovecot	IMAP/POP3 mail delivery agent	dovecot-core, dovecot-imapd
SSH / Remote Access	OpenSSH Server	Secure remote shell access	openssh-server
DNS / Proxy / Cache	Bind9	DNS server	bind9
	Squid	Caching proxy server	squid
Container Platforms	Docker	Containerized application deployment	Install via Docker repo
	Podman	Daemonless container engine	podman
Monitoring / Logging	Prometheus	Monitoring & metrics	prometheus
	Grafana	Visualization dashboard	grafana
	Logrotate	Log file management	logrotate
	rsyslog	System logging daemon	rsyslog
CI/CD / DevOps	Jenkins	Automation server for CI/CD pipelines	Install via Jenkins repo

	GitLab Runner	CI/CD runner for GitLab	gitlab-runner
Firewall / Security	UFW	Uncomplicated Firewall	ufw
	Fail2ban	Ban malicious IPs	fail2ban
	iptables	Advanced firewall rules	iptables

Would you like me to categorize them based on **default Ubuntu installations vs. optional installs** or **preinstalled in cloud images (like EC2/VMs)**?
