1. **Compute Services**:

- **AWS EC2 (Elastic Compute Cloud):** This service provides resizable compute capacity in the cloud. It allows you to quickly scale capacity both up and down as your computing requirements change.

2. **Storage Services**:

- **Amazon S3 (Simple Storage Service):** Amazon S3 provides object storage through a web interface. It is designed to store and retrieve any amount of data from anywhere on the web.

3. **Database Services**:

- **Amazon RDS (Relational Database Service):** RDS simplifies setting up, operating, and scaling a relational database in the cloud. It supports various database engines such as MySQL, PostgreSQL, SQL Server, etc.

- Amazon DynamoDB: DynamoDB is a fully managed NoSQL database service designed to provide fast and predictable performance with seamless scalability.

4. **Networking Services**:

- **Amazon VPC (Virtual Private Cloud):** VPC allows you to provision a logically isolated section of the AWS Cloud where you can launch AWS resources in a virtual network.

- AWS Direct Connect: This service establishes a dedicated network connection between your premises and AWS, providing consistent network performance and reducing data transfer costs.

5. **Serverless Compute Services**:

- **AWS Lambda:** Lambda lets you run code without provisioning or managing servers. It automatically scales your application by running code in response to triggers.

- Amazon API Gateway: API Gateway is a fully managed service that makes it easy for developers to create, publish, maintain, monitor, and secure APIs at any scale.

6. **Container Services**:

- **Amazon ECS (Elastic Container Service):** ECS is a fully managed container orchestration service that supports Docker containers. It allows you to easily run, stop, and manage containers on a cluster.

- Amazon EKS (Elastic Kubernetes Service): EKS is a managed Kubernetes service that makes it easy to deploy, manage, and scale containerized applications using Kubernetes on AWS.

7. **Identity and Access Management**:

- **AWS IAM (Identity and Access Management):** IAM enables you to securely control access to AWS services and resources for your users. You can create and manage users, groups, and permissions to grant or deny access as needed.

8. **Monitoring and Logging**:

- **Amazon CloudWatch:** CloudWatch provides monitoring for AWS cloud resources and applications. It collects and tracks metrics, monitors log files, and sets alarms to help you respond to changes in your AWS resources.

- AWS CloudTrail: CloudTrail records AWS API calls and related events made by or on behalf of your AWS account. It provides visibility into user activity and resource changes.

9. **AI and Machine Learning Services**:

- **Amazon SageMaker:** SageMaker is a fully managed service that provides every developer and data scientist with the ability to build, train, and deploy machine learning models quickly.

- Amazon Comprehend: Comprehend is a natural language processing (NLP) service that uses machine learning to find insights and relationships in text data.

10. **Development and Deployment Tools**:

- **AWS CodeDeploy:** CodeDeploy automates code deployments to any instance, including EC2 instances and on-premises servers. It allows you to consistently deploy your applications across your development, test, and production environments.

- AWS CodePipeline: CodePipeline is a continuous integration and continuous delivery (CI/CD) service that automates the build, test, and deploy phases of your release process for quick and reliable application updates.
