Here's a **table of the most commonly used container orchestration technologies** in **real-time IT companies**, showing their **usage, purpose, and key features**

Container Orchestration Technology	Common Usage in IT Companies	Description / Purpose	Key Features	Example Companies / Use Cases
Kubernetes (K8s)	⭑ **Most widely used** (Industry Standard)	Open-source system for automating deployment, scaling, and management of containerized applications.	Auto-scaling, rolling updates, self-healing, load balancing, declarative YAML configuration.	Google, AWS (EKS), Azure (AKS), Red Hat OpenShift, Netflix, Spotify
Docker Swarm	Common in **small to mid-size** deployments	Native clustering and orchestration tool for Docker containers.	Easy setup, Docker-native commands, less complex than Kubernetes.	Small startups, dev/test environments, simple microservice apps
Amazon ECS (Elastic Container Service)	Popular in **AWS-based** environments	AWS-managed container orchestration for Docker containers.	Deep AWS integration, Fargate serverless option, IAM-based security.	Amazon, Expedia, Intuit
Amazon EKS (Elastic Kubernetes Service)	Common in **AWS cloud**	Managed Kubernetes service provided by AWS.	Kubernetes API compatible, automated control plane management, scalability.	AWS Cloud customers, large enterprises
Azure Kubernetes Service (AKS)	Used in **Azure Cloud** environments	Microsoft-managed Kubernetes service.	Integrated with Azure AD, monitoring via Azure Monitor, automatic upgrades.	Accenture, Adobe, HSBC
Google Kubernetes Engine (GKE)	Used in **GCP environments**	Google-managed Kubernetes service with advanced automation.	Auto-scaling, logging, monitoring, AI/ML integration.	Spotify, Snap Inc., PayPal

Red Hat OpenShift	Used by **enterprises** requiring security and hybrid deployment	Enterprise Kubernetes platform by Red Hat.	Developer tools, CI/CD pipelines, integrated security.	IBM, Dell, T-Mobile
Rancher	Used for **multi-cluster Kubernetes management**	Open-source platform for managing multiple Kubernetes clusters.	Centralized management, multi-cloud support, easy cluster provisioning.	SUSE, Verizon, fintech firms
Nomad (by HashiCorp)	Used in **DevOps automation** & **multi-platform orchestration**	Lightweight orchestrator for containers, VMs, and non-containerized apps.	Simpler than Kubernetes, integrates with Consul & Vault.	Roblox, Cloudflare
Mesosphere DC/OS (based on Apache Mesos)	Declining but still used in **legacy enterprise systems**	Distributed systems kernel for running containers and big data workloads.	Resource isolation, scalability, Hadoop/Spark support.	Twitter (historically), Airbnb, Apple (legacy use)

✅ **Summary:**

- **Kubernetes** is the **de facto industry standard** and used in **~85%** of real-world IT container orchestration systems.
- **Docker Swarm** is used for **simpler projects**.
- **Cloud-managed Kubernetes services** like **EKS, AKS, GKE** dominate enterprise cloud deployments.
- **OpenShift** and **Rancher** are popular in **enterprise and hybrid-cloud** environments.

Would you like me to add another column showing **"Best suited for (Small / Mid / Large companies)"** or **"Learning difficulty level"** for better comparison?
