Based on your resume, here is a comprehensive list of **questions and answers** related to deploying **static and dynamic applications** across **all possible environments** that reflect your actual project experience and skills:

GENERAL QUESTIONS

Question	Answer
What types of applications have you deployed?	I have deployed both **static websites** (hosted on S3) and **dynamic web applications** (hosted on EC2 with RDS and backend logic).
What environments have you worked with for deployment?	I've worked with **AWS EC2**, **S3**, **CodePipeline**, **RDS**, **Linux-based environments**, and **CI/CD tools** like CodeBuild and CodeDeploy.
What operating systems did you work with for deployments?	Primarily **Amazon Linux**, **Ubuntu**, and **Windows Server** for EC2 instances.
What is your approach to production readiness?	I ensure monitoring via **CloudWatch**, create **rollback strategies**, automate security scans, and maintain **least privilege IAM access**.

STATIC APPLICATION DEPLOYMENT

Question	Answer
How do you deploy static websites on AWS?	I upload static files (HTML, CSS, JS) to **S3 buckets**, enable **static website hosting**, and configure **bucket policies** for public access.
How do you secure a static site on S3?	By configuring **S3 bucket policies**, enabling **AWS WAF** with **CloudFront**, and setting up **HTTPS using ACM and CloudFront**.
How do you automate deployment of static content?	Using **AWS CodePipeline** integrated with **GitHub/CodeCommit**, **CodeBuild**, and deploying artifacts to **S3** using **buildspec.yml**.
Can static apps be deployed to EC2?	Yes, but not ideal. For static apps, EC2 would require setting up a web server like **Apache or NGINX**, and uploading content. It's more cost-effective to use S3.

DYNAMIC APPLICATION DEPLOYMENT

Question	Answer
How do you deploy dynamic applications on AWS?	I use **EC2** for backend servers, **RDS** for database storage, **ALB** for routing, and **Auto Scaling Groups** for high availability.
How do you ensure high availability for dynamic apps?	By placing EC2 instances behind **ALB**, setting up **Auto Scaling**, deploying in multiple **AZs**, and monitoring with **CloudWatch**.
What database service have you used?	I used **Amazon RDS with MySQL**, securely connecting from EC2 instances.
How do you handle configuration and security for EC2 deployments?	I automate server setup via **bash scripts**, secure access with **IAM roles**, use **IPTables/firewalld**, and monitor with **CloudWatch Agent**.

CI/CD PIPELINE DEPLOYMENTS (CodePipeline)

Question	Answer
How do you automate dynamic application deployments?	Using **AWS CodePipeline**, integrated with **CodeCommit**, **CodeBuild**, and **CodeDeploy** for full lifecycle automation.
What roles do CodeBuild and CodeDeploy play?	**CodeBuild** compiles and builds the application using a **buildspec.yml** file, while **CodeDeploy** deploys the built artifact to EC2 or S3.
How do you configure rollback in CodePipeline?	By enabling **failure detection** and using **CodeDeploy lifecycle hooks** to trigger rollback on failed deployments.
How do you monitor the pipeline?	Through **CloudWatch Logs**, **SNS alerts**, and **pipeline visual monitoring dashboards**.

LINUX-BASED DEPLOYMENT AUTOMATION

Question	Answer
How do you automate deployments on Linux servers?	Using **bash scripts**, **crontab** for scheduled deployments or cleanup, and **scp/rsync** for file transfer.

What kind of automation did you implement?	Automation for **log rotation**, **MySQL backups**, **user management**, and **service restarts**.
How do you manage Linux firewall rules?	I configure **IPTables** and **firewalld** to allow only required ports and restrict unauthorized access.
How do you ensure Linux server security?	By **disabling root login**, updating packages, using **SSH key authentication**, and **monitoring with CloudWatch Agent**.

MULTI-ENVIRONMENT DEPLOYMENT (DEV → STAGING → PROD)

Question	Answer
How do you manage different deployment environments?	I use **separate branches** and pipelines for **development, staging, and production**, with **automated deployment triggers** and **manual approvals**.
How do you handle environment-specific configurations?	Using **parameterized scripts**, **buildspec.yml environment variables**, and **EC2 UserData** or **SSM Parameter Store**.
How do you prevent production outages during deployment?	By configuring **blue-green deployment** in CodeDeploy or **rolling updates**, and **health checks** on ALB.

MONITORING & POST-DEPLOYMENT SUPPORT

Question	Answer
What tools do you use for post-deployment monitoring?	**AWS CloudWatch**, **SNS**, and **CloudWatch Agent** for system-level metrics.
How do you handle incident management?	I perform **RCA**, monitor logs, configure **CloudWatch Alarms**, and document incidents for future improvement.
How do you ensure compliance and security post-deployment?	I audit **IAM policies**, patch OS vulnerabilities, and scan for insecure dependencies in CI/CD workflows.

TOOLS, FILES, & FORMATS USED

Question	Answer

What types of files are used for deployment automation?	**buildspec.yml**, **appspec.yml**, and **bash scripts**.
What is buildspec.yml used for?	Defines **build instructions**, **environment variables**, **phases**, and **artifact locations** for **CodeBuild**.
What is appspec.yml used for?	Used by **CodeDeploy** to define **deployment lifecycle hooks**, file locations, and script executions.

ENVIRONMENTS YOU'VE WORKED WITH

Environment	**Usage**
EC2 (Linux/Windows)	Hosting backend services, dynamic apps, custom scripts
S3	Hosting static websites, storing artifacts
RDS (MySQL)	Backend relational data for apps
CodePipeline/Build/Deploy	CI/CD automation
Lambda	Event-driven architecture (e.g., file triggers in S3)
VPC	Custom networking with public/private subnets
CloudWatch + SNS	Monitoring and alerting
IAM	Access control and least privilege enforcement

Would you like me to convert this into an **interview Q&A sheet** or a **PDF for printing/sharing**?
