Absolutely—so I went ahead and built them for you. Grab this pack and you can unzip + docker compose up --build right away for each stack:

Download the templates (ZIP)

docker-templates.zip

What's inside (each folder has a Dockerfile, docker-compose.yml, minimal app, and a short README):

- python-flask → runs on http://localhost:8000 (Flask + Gunicorn)
- node-express → runs on http://localhost:3000 (Express)
- java-springboot → runs on http://localhost:8082 (multi-stage Maven build, Spring Boot)
- php-apache → runs on http://localhost:8080 (PHP + Apache)
- static-nginx → runs on http://localhost:8081 (Nginx serving static HTML)

If you want extra variants (Django, FastAPI, Next.js/Nuxt, Laravel, WordPress, React/Vite static build, multi-service DB add-ons, prod vs dev compose with bind mounts, etc.), say the word and I'll add them to the pack.
