Here's a table listing common **default or widely used servers** and platforms available for **deploying applications and running inside Docker containers on Ubuntu 22.04**. These are typically pre-installed in base images or easily installable via APT or Docker Hub.

Default Servers for Docker Deployment on Ubuntu 22.04

Category	Server/Platform	Description	Default in Docker Base Image?	Install via APT
Web Servers	**Nginx**	High-performance, lightweight web server and reverse proxy	✗ (Use official image)	✓
	Apache HTTPD	Popular full-featured HTTP server	✗ (Use official image)	✓
Application Servers	**Node.js**	JavaScript runtime often used for backend APIs	✗ (Use node image)	✓
	Python (Gunicorn)	WSGI server for running Python web apps like Flask/Django	✗ (Use python image)	✓
	Java (Tomcat)	Java-based application server for running JSP/Servlets	✗ (Use tomcat image)	✓
	PHP-FPM	FastCGI Process Manager for PHP apps	✗ (Use php image)	✓
	.NET (Kestrel)	Web server for .NET Core applications	✗ (Use mcr.microsoft.com/dotnet)	✗ (Install manually)
Databases	**MySQL/MariaDB**	Relational database server	✗ (Use official image)	✓
	PostgreSQL	Advanced relational DBMS	✗ (Use official image)	✓
	MongoDB	NoSQL document-oriented database	✗ (Use official image)	✓ Manual setup)

	Redis	In-memory key-value store (cache/database)	✗ (Use official image)	✓
CI/CD & DevOps	**Jenkins**	Automation server for building CI/CD pipelines	✗ (Use jenkins/jenkins)	✓
	GitLab Runner	Used to run GitLab CI/CD pipelines	✗	✓
Container Orchestration	**Docker**	Installed by default in Docker containers is Docker Engine (host side)	✓ (on host, not inside container)	✓
	K3s / K3d / Minikube	Lightweight Kubernetes distributions for local Docker use	✗ (Manual setup)	✗
Monitoring Tools	**Prometheus**	Monitoring and alerting toolkit	✗ (Use official image)	✓
	Grafana	Visualization and dashboard server	✗ (Use official image)	✓
	ELK Stack (Elasticsearch, Logstash, Kibana)	Log aggregation and monitoring stack	✗ (Use images separately)	✓ (with effort)
Messaging & Queuing	**RabbitMQ**	Message broker server for async communication	✗ (Use official image)	✓
	Kafka	Distributed event streaming platform	✗ (Use Confluent image)	✓ (via script)
FTP & File Servers	**vsftpd**	Secure FTP server	✗	✓
	Samba	File server for SMB/CIFS sharing	✗	✓
Security Tools	**Fail2ban**	Protects containers/servers from brute-force attacks	✗	✓

	UFW (Uncomplicated Firewall)	Simple firewall tool	✅ (default on Ubuntu)	✅

Notes:

- Most production-ready Docker containers are built **from scratch using Alpine, Debian, or Ubuntu base images**, and the servers are **manually installed in the Dockerfile**.
- For rapid deployment, it's common to **use prebuilt official Docker images** for each server (e.g., nginx, mysql, node, python, redis, jenkins, etc.)
- **Ubuntu 22.04 containers** generally come very minimal; almost no server is pre-installed unless you define it in a Dockerfile.

Would you like a ready-to-use Dockerfile example for any of these servers?
