list of all GCP IaaS services

Google Cloud Platform (GCP) offers a range of Infrastructure as a Service (IaaS) services to cater to various infrastructure needs. Here is a list of the primary GCP IaaS services:

1. Compute Engine: Virtual machines that run on Google's infrastructure. You can run large-scale workloads on virtual machines optimized for your needs.

2. Persistent Disk: Block storage that you can attach to your virtual machine instances. It provides durable and high-performance storage.

3. Cloud Storage: Scalable object storage service for storing and accessing data. It is ideal for unstructured data such as images, videos, and backups.

4. Filestore: Managed file storage service for applications that require a filesystem interface and a shared filesystem for data. It provides network-attached storage (NAS).

5. Google Kubernetes Engine (GKE): Managed Kubernetes service that allows you to run, manage, and scale containerized applications using Google infrastructure.

6. GPU Support: Allows you to attach NVIDIA GPUs to your virtual machines for high-performance computing tasks such as machine learning and scientific simulations.

7. Preemptible VMs: Low-cost, short-lived instances suitable for batch processing and fault-tolerant workloads. These instances are significantly cheaper but may be terminated by Google Cloud.

8. Local SSD: High-performance local storage that you can attach to your virtual machine instances. It is ephemeral storage suitable for temporary storage needs.

9. TPUs (Tensor Processing Units): Google's custom-developed application-specific integrated circuits (ASICs) used to accelerate machine learning workloads.

10. Bare Metal Solution: Provides dedicated physical servers for workloads that require specialized hardware and are not suitable for virtualization.

11. Cloud DNS: Scalable, reliable, and managed authoritative Domain Name System (DNS) service running on the same infrastructure as Google.

12. Cloud Load Balancing: Distributes user traffic across multiple Compute Engine instances to ensure reliability and high availability.

13. Virtual Private Cloud (VPC): Provides networking services, including subnetworks, routing, and firewall rules, for your Google Cloud resources.

14. Cloud Interconnect: Offers a dedicated, private connection from your on-premises network to your Google Cloud VPC network.

15. Cloud VPN: Allows you to securely connect your on-premises network or another cloud provider to your Google Cloud VPC network using IPsec VPN.

These IaaS services form the foundational infrastructure layer of Google Cloud, allowing users to build, deploy, and scale applications and services with flexibility and control over their computing resources.
