Laravel Cloud (often referred to as **Laravel Forge**, **Laravel Vapor**, and other Laravel ecosystem services) provides managed infrastructure solutions built specifically for deploying Laravel applications. These do not always map one-to-one with AWS services, but they **abstract and utilize AWS behind the scenes** (especially in Laravel Vapor). Below is a comparative list based on your categories:

---

1. Compute Services

AWS	Laravel Equivalent
Amazon EC2	**Laravel Forge** provisions and manages EC2 instances on your behalf for PHP/Laravel hosting.
	Laravel Vapor uses **AWS Lambda** for serverless hosting (no EC2 directly).

---

2. Storage Services

AWS	Laravel Equivalent
Amazon S3	**Laravel Vapor** integrates directly with S3 for file storage. You configure asset and file storage on S3 buckets.
	Forge can also be configured to use S3.

---

3. Database Services

AWS	Laravel Equivalent
Amazon RDS	Both **Forge** and **Vapor** support and manage **RDS** (MySQL, PostgreSQL).
DynamoDB	Not natively supported in Forge/Vapor UI, but can be integrated manually.

---

4. Networking Services

AWS	Laravel Equivalent
Amazon VPC	**Laravel Vapor** automatically configures networking (VPC,

	subnets, NAT) for your serverless app.
AWS Direct Connect	Not directly used in Laravel services, but you can configure it if managing VPC manually.

---

5. Serverless Compute Services

AWS	Laravel Equivalent
AWS Lambda	**Laravel Vapor** runs your Laravel app **entirely serverless using Lambda**.
Amazon API Gateway	**Laravel Vapor** uses **API Gateway** to expose your Laravel routes to the internet.

---

6. Container Services

AWS	Laravel Equivalent
Amazon ECS / EKS	Not directly used. **Laravel Forge** and **Vapor** do not support Docker containers natively, though custom deployments can integrate ECS.

---

7. Identity and Access Management

AWS	Laravel Equivalent
AWS IAM	**Laravel Vapor** uses **IAM roles and policies** under the hood. You assign IAM credentials during project setup.
	Forge also uses IAM credentials when provisioning instances and managing services.

---

8. Monitoring and Logging

AWS	Laravel Equivalent
CloudWatch	**Laravel Vapor** uses **CloudWatch Logs** to show

	application logs (accessible in the Vapor dashboard).
CloudTrail	Not directly exposed in Vapor/Fogre, but all activities are logged under your AWS account.

---

9. Development and Deployment Tools

AWS	**Laravel Equivalent**
AWS CodeDeploy / CodePipeline	**Laravel Forge** provides **Git-based deployments** and hooks.
	Laravel Vapor uses **Vapor CLI** to deploy code and manage environments with CI/CD integration options.

Summary Table:

Category	**AWS**	**Laravel Cloud Equivalent**
Compute	EC2	Laravel Forge
	Lambda	Laravel Vapor
Storage	S3	Vapor / Forge (S3 integration)
Database	RDS	Vapor / Forge (MySQL/PostgreSQL)
Networking	VPC	Vapor (auto-configures VPC)
Serverless	Lambda + API Gateway	Laravel Vapor
Containers	ECS / EKS	Not natively supported
IAM	AWS IAM	IAM roles configured via Vapor/Forge
Monitoring & Logging	CloudWatch, CloudTrail	CloudWatch Logs via Vapor
Dev & Deployment Tools	CodeDeploy, CodePipeline	Vapor CLI, Forge Git Deployments
