Here's a table showing **one-time activities** and **day-to-day activities** for each Linux-related job role you listed. These responsibilities are categorized to clearly show the distinction between tasks that are typically performed once (during setup, configuration, or major changes) versus those that are handled regularly.

Job Role	One-Time Activities	Day-to-Day Activities
Linux Specialist	- Design optimized Linux-based systems - Set up automation and scripting framework	- Troubleshoot complex Linux issues - Support performance tuning and patching
Linux System Administrator	- Initial OS installation - Disk partitioning and user policy setup	- Monitor system health - Manage users, backups, updates
Linux Administrator	- Configure server roles (DNS, NFS, LDAP) - Set up SELinux or AppArmor	- Regular log analysis - Respond to incidents, user issues
Linux Engineer	- Architect new infrastructure - Build deployment scripts and CI/CD Linux support	- Kernel tuning - Manage packages, services, and server performance
Unix Linux System Administrator	- OS and middleware stack installation- Integrate Unix/Linux tools	- Maintain server uptime - Patch Unix/Linux OS, troubleshoot issues
Senior Linux Administrator	- Implement advanced storage solutions - Design HA and DR for Linux environments	- Review and manage cron jobs - Audit and enforce security policies
Linux Consultant	- Assess client's Linux infrastructure - Design automation or migration strategy	- Guide ongoing improvements - Review logs, performance reports
Linux Developer	- Build Linux kernel modules or drivers - Develop automation scripts	- Maintain shell/python scripts - Debug Linux-based apps or services
Senior Linux System Administrator	- Lead system migration or upgrades - Create Linux architecture standards	- Supervise backups and patching - Lead root cause analysis and incident response
Unix Linux Administrator	- Configure Unix/Linux hybrid systems - Set baseline configurations	- Regular OS patching - File system maintenance and user account management

Notes:

- **One-Time Activities** are often project-based or occur during initial deployment or major changes.
- **Day-to-Day Activities** include operational, maintenance, and monitoring tasks.
- The **seniority** level determines the scope: senior roles may focus more on architecture, automation, and mentoring.
- **Consultants** and **specialists** often span both, depending on client/project needs.

Let me know if you'd like this customized per industry (e.g., finance, healthcare) or by cloud platform (AWS, Azure, GCP).

Here's the **enhanced table** of Linux-related roles with responsibilities broken down by:

1. **One-Time vs Day-to-Day Activities**
2. **DevOps vs Non-DevOps**
3. **Cloud Platform Involvement (AWS / Azure / GCP)**

Categorized Table: Linux Job Roles with One-Time & Day-to-Day Activities + DevOps/Cloud Tags

Job Role	One-Time Activities	Day-to-Day Activities	DevOps / Non-DevOps	Cloud Platform Involvement (AWS / Azure / GCP)
Linux Specialist	- Design and harden Linux infrastructure - Configure monitoring tools	- Analyze logs - Apply performance tuning and patching	Both	AWS (CloudWatch, EC2)Azure (VMs, Monitor) GCP (Compute Engine)
Linux System Administrator	- Install OS and packages - Set up LVM, RAID, or disk partitions	- Manage users - Monitor servers, schedule backups, respond to alerts	Non-DevOps	AWS (EC2, SSM) Azure (Azure VMs) GCP (VMs, Stackdriver)
Linux Administrator	- Configure initial server stack (DNS, NFS, LDAP) - Implement firewalls (iptables)	- Patch management-Respond to help desk or server tickets	Non-DevOps	Mostly on-premSome AWS EC2/GCP VM/Azure VM administration

Linux Engineer	- Build automation scripts (Ansible, Bash, Python) - Configure CI/CD for Linux	- Maintain system configs - Kernel tuning - Enhance deployment scripts	DevOps	AWS (EC2, CodeDeploy) Azure DevOpsGCP (Cloud Build, GKE)
Unix/Linux System Administrator	- OS + Middleware configuration - Integrate Unix/Linux file systems	- File system expansion - Monitor server health	Non-DevOps	Cloud or hybrid: AWS EC2Azure VMsGCP Compute Engine
Senior Linux Administrator	- Design high-availability Linux clusters - Architect secure Linux environments	- Audit logs - Coordinate backups, lead incident response	Both	AWS (Auto Scaling, ALB) Azure Scale SetsGCP Load Balancer
Linux Consultant	- Assess client infra - Plan Linux system migration to cloud	- Recommend best practices - Review metrics/logs	DevOps	AWS migration, Azure assessment, GCP evaluation (based on engagement)
Linux Developer	- Build kernel modules or OS -level tools-Develop automation scripts (e.g. for CI)	- Script improvements - Debug Linux-related app issues	DevOps	AWS Lambda (automation) Azure FunctionsGCP Cloud Functions
Senior Linux System Administrator	- Architect full infra stack (OS, security, storage) - Lead major upgrades	- Supervise OS-level changes - Lead patching and compliance efforts	Both	AWS GovCloud, Azure Gov/Enterprise, GCP Premium Support (for large infra)
Unix/Linux Administrator	- Hybrid system config (Unix/Linux) - Setup job schedulers (cron, systemd timers)	- Routine updates - User access management	Non-DevOps	Mostly IaaS on any cloud – EC2, Azure VMs, GCP VM/OS patching

---

Summary of Categories:

Category	Explanation
DevOps	Roles that involve scripting, automation, CI/CD, cloud-native tools
Non-DevOps	Traditional roles focused on manual administration, support, patching
AWS	EC2, CloudWatch, SSM, ALB, CodeDeploy, Lambda, etc.
Azure	Azure VMs, Azure Monitor, Log Analytics, Azure Functions
GCP	Compute Engine, Stackdriver, Cloud Build, GKE, Cloud Functions

---
