Here's a detailed table comparing **one-time activities**, **day-to-day activities**, and **typical experience required** for each of the mentioned **Java job roles**. Note that roles may overlap slightly across organizations, but this table provides general expectations:

Job Role	One-Time Activities	Day-to-Day Activities (Roles & Responsibilities)	Experience Required
Java Software Engineer	Project setup, framework selection, environment configuration.	Coding, debugging, writing unit tests, participating in code reviews, fixing bugs, deploying code.	2-5 years
Java Software Developer	Initial environment setup, requirement analysis for a module.	Develop new features, maintain existing code, attend scrum meetings, write documentation.	1-4 years
Java Programmer	Setup dev tools, initial codebase creation.	Writing and optimizing Java code, handling backend logic, fixing errors in programs.	0-3 years
Java Engineer	Framework/architecture setup, service design decisions.	Build and support backend APIs, database operations, participate in Agile ceremonies.	2-5 years
Java Developer	Repository setup, build configuration, CI/CD setup (sometimes).	Write Java code, test functionality, collaborate with teams, fix production issues.	1-4 years
Java Specialist	Technical audit, choosing architecture patterns, creating guidelines.	Performance tuning, troubleshooting complex problems, code mentoring, advising on best practices.	5-8 years
Senior Java Software Engineer	Define coding standards, module architecture design, setup initial pipelines.	Lead development, code review, solve complex issues, mentor juniors, design scalable systems.	5-10 years
Senior Java Programmer	Database schema finalization, tool selection for project.	Write optimized code, ensure code quality, handle complex modules, guide junior developers.	4-8 years
Senior Java Engineer	System design and architectural decisions, major system refactoring (when required).	Hands-on coding, lead sprints, solve performance bottlenecks, collaborate with cross-functional teams.	5-10 years

Senior Java Developer	Solutioning, high-level design documentation.	Develop and review code, handle production issues, implement best practices, guide teams.	5-10 years
Junior Java Developer	IDE setup, first-time codebase download, simple utility build.	Write simple code, fix small bugs, learn code standards, support QA fixes.	0-2 years
Java Consultant	Solution proposal, technical assessment, architecture setup, tech stack recommendation.	Review client systems, recommend solutions, solve critical issues, offer best practice guidance.	6-12 years
Java Web Developer	Frontend-backend integration setup, initial page templating, project scaffolding.	Build web applications using Java frameworks (Spring MVC, JSP), handle backend APIs, UI fixes, collaborate with frontend teams.	1-4 years
Java Analyst	Business requirements analysis, documentation of technical flows, initial process mapping.	Analyze systems, write BRDs/FRDs, support developers with data analysis, help in gap analysis, performance monitoring.	3-6 years
Lead Java Developer	Define project architecture, plan resource allocation, setup version control workflows.	Oversee development, track project progress, resolve blockers, mentor team, conduct code reviews, ensure timely delivery.	8-12 years
Senior Java Consultant	Enterprise system assessments, roadmap definition, architecture planning, defining integration patterns.	Technical advisory role, client interaction, solution recommendations, performance audits, code quality evaluations, governance checks.	10+ years
Java Architect	Solution architecture creation, system blueprints, technology roadmap, PoC development.	Define technical strategy, design system architecture, evaluate new technologies, mentor teams, ensure solution scalability and maintainability.	12+ years
Java Team Lead	Team formation, setup of project processes, defining roles.	Manage team, allocate work, track progress, resolve conflicts, code reviews, reporting to management,	7-10 years

		ensuring sprint goals are achieved.	
Java Application Developer	Application architecture setup, module planning, environment provisioning.	Develop and maintain Java applications, handle change requests, ensure smooth releases, troubleshoot runtime issues, work on integrations.	2-5 years

---

Notes:

- **One-Time Activities** generally occur at the **project start** or during **major upgrades**.
- **Day-to-Day Activities** focus on ongoing **development, maintenance, and issue resolution**.
- **Experience** ranges are **typical industry expectations** but may vary by company or project complexity.
