Here's a clear **table format** outlining **one-time activities** vs. **day-to-day activities** for the various Java-related roles. This should help differentiate responsibilities at different levels and designations:

Role	One-Time Activities	Day-to-Day Activities
Java Software Engineer	Initial system setup, module design	Writing/modifying code, debugging, unit testing, code reviews
Java Software Developer	Project environment setup, architecture familiarization	Code development, issue resolution, attending stand-ups
Java Programmer	Learning system architecture	Pure coding, bug fixing, code optimization
Java Engineer	API design, module integration	Developing APIs, unit testing, participating in sprint activities
Java Developer	Toolchain setup, initial environment configuration	Writing, testing, and maintaining Java code
Java Specialist	Designing specialized frameworks or solutions	Providing expertise, troubleshooting, mentoring junior team members
Senior Java Software Engineer	Leading component design, tech-stack decisions	Reviewing code, developing critical modules, mentoring, daily coordination
Senior Java Programmer	Designing reusable libraries	Code implementation, guiding juniors, bug resolution
Senior Java Engineer	System design input, architecture discussions	Coding, problem-solving, technical guidance, release support
Senior Java Developer	Architecture evaluation, PoC development	Code reviews, task allocation, solution design, development
Junior Java Developer	Initial project setup, training, understanding architecture	Writing code, fixing simple bugs, attending stand-ups
Java Consultant	Solution blueprint, client environment assessment	Solution advice, code review, troubleshooting, client communication
Java Web Developer	Setting up front-end/backend integration	Developing web services, front-end/back-end integration
Java Analyst	Requirement gathering, system analysis	Data analysis, defect tracking, preparing technical reports
Lead Java Developer	Project planning, team setup, architecture approval	Task assignment, technical leadership, monitoring progress, stakeholder communication

Senior Java Consultant	Designing strategic solutions, architecture recommendation	Advising teams, reviewing architecture, ensuring best practices
Java Architect	Creating system architecture, high-level design, technology selection	Guiding teams, reviewing designs, resolving critical technical issues
Java Team Lead	Team setup, backlog grooming, process definition	Sprint planning, team mentoring, code reviews, progress reporting
Java Application Developer	Application setup, tool installation	Application development, bug fixing, feature enhancement

---

Clarifications:

- **One-Time Activities** are typically done once per project phase or rarely during project lifecycle—like setup, design, or initial planning.
- **Day-to-Day Activities** are routine tasks handled on an ongoing basis.
